It elongates telomeres. It is a reverse transcriptase that adds simple sequence repeats to chromosome ends by copying a temp sequence within the RNA component of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   \exists

It is a reverse transcriptase that adds
equence repeats to chromosome ends by copying a template
within the RNA component of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LRFMCHHAVRIRGKSYVQCQGIPQGSILSTLLCSLCYGDMENKLFAGIRRD-----

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hyosins are actin-based motor molecules with ArPase. Unconventional myosins serve in intracellular movements. ghly divergent tails are presumed to bind to membranous ents, which would be moved relative to actin filaments (By ty). May play a role in the formation or maintenance of north structures of the inner ear sensory hair cells.

PEGIFICITY: Detected at intermediate levels in spleen. Jland, in heart, kidney, brain, liver, testis, bone marrow, sland, lymph nodes, pancreas and thymus. Sphorylation on Ser-20 interferes with UZAF2 binding and one assembly (By similarity). IY: Contains 1 CCHC-type zinc finger. IY: Contains 1 KH domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Binds UZAF2. Interacts with UI snRNA. Binds EWSR1, FUS 5 (By similarity).

Makabayashi Y., Takahashi Y., Kikkawa Y., Okano H., Mishima Y., Makabayashi Y., Takahashi Y., Kikkawa Y., Okano H., Mishima Y., Makabayashi Y., Takahashi Y., Kikkawa Y., Okano H., Mishima Y., A novel type of myosin encoded by the mouse deafness gene shaker Biochem. Biophys. Res. Commun. 248:655-659(1998).

-I-FUNCTION: Myosins are actin-based motor molecules with ATPase activity. Unconventional myosins serve in intracellular moven Their highly divergent tails are presumed to bind to membrance shall anilarity. May play a role in the formation or maintenance the actin-rich structures of the inner ear sensory hair cells the actin-rich structures of the inner ear sensory hair cells cochlea and vestibular apparatus. Expression appears to be restricted to cochlear neurosensory cells and upper epithelis are confisted ampullaris of the semicircular canals. In adult cochlear cristae ampullaris of the semicircular canals. In adult cochlear cristae ampullaris of the semicircular canals. In adult cochlear calls. Highest expression in stereocilla and apical body condition causing deafness, circling behavior, head tossing a hyperactivity. Auditory hair cells of affected animals have verical end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probst F.J., Fridell R.A., Raphael Y., Saunders T.L., Wang A., Liang Y., Morell R.J., Touchman J.W., Lyons R.H., Noben-Trauth K. nopus Deltex homologue expressed in differentiating in photoreceptive organs.';
'atterns 2:283-287(2002).
'! Regulator of Notch signaling, a signaling pathway in cell-cell communications that regulates a broad of of cell-fate determinations. Probably acts both as a and negative regulator of Notch, depending on the lental and cell context. May function as an ubiquitin rotein for the Notch pathway (By similarity).

May form a homo- or heteromultimer with other members of ex family. Probably interacts with Notchi (By similarity).

PECIFICITY: Specifically expressed in regions undergoing differentiation. Mainly colocalizes with Notchi.

olfactory bulbs, pineal complex and along the neural tube according to an antero-posterior gradient showing a gap at midbrain-hindbrain boundary. At tadpole stage, it is expressive differentiating retina, in the neuronal fibers of the or and inner plexiform layers, while its expression in the pin complex becomes restricted to the photopensistive frontal or DOMAIN: The WWE Gomains are thought to mediate some protein protein interaction, and are frequently found in ubiquitin. This SWISS-PROT entry is copyright. It is produced through a cobetween the Swiss Institute of Bioinformatics and the EMBL on the European Bioinformatics Institute.
